

Symmetric structured-RNA motif panel

The primary focused-decision report with explicit evidence boundaries.

Question

Can paired structured RNA elements selectively preserve a productive assembly state rather than merely increase mature RNA abundance?

Mechanism

The panel tests whether symmetric protection changes the residence-time distribution of intact RNA near the productive complex.

Decisive test

Separate bulk abundance, assembly-proximal state, intended product, byproducts, and burden in matched conditions.

Kill criterion

Stop if product follows mature abundance alone or if product quality worsens at matched activity.
